Clinical Implications of Recent Research Results in Arteriosclerosis Robert W: Hauss, Robert W. Wissler, 2013-04-18 The survey of the following epidemiologic studies of Institut fUr Arterioskleroseforschung in MUnster was given 1 Follow up study to analyze longterm mortality after myocardial infarction and individual risk of death 2 Secondary preventive study after myocardial infarction under the conception of mesenchymal suppression 3 Prospective study to find out the predictive power of cholesterol sub fractions 4 Study of old age probands The advantage of our infrastructure of the epidemiologic work lies in the close connection to the clinical medicine as the scientific planning and guidance is done by physicians and teachers of university clinic There is less danger that irrelevant problems are followed or that non medical researchers like statisticians will dominate the studies We have deliberately avoided to join or organize multicenter studies believing that a larger output of data cannot outweigh the disadvantages of possible mistakes and errors through lack of contact and controversial conceptions among the coworkers We hope to show that studies planned for screening of as many as 10 000 probands can be performed at relatively low expense An important point is the adaptability of our system which enables us

to enlarge the already running studies for instance by addition of parameters like blood coagulation as is being prepared by the team of Professor van de Loo in MUnster
