Tectonic Development of the Eastern Mediterranean Region A. H. F. Robertson, Demosthenis Mountrakis, 2006 The Eastern Mediterranean region is a classic area for the study of tectonic processes and settings related to the development of the Tethyan orogenic belt The present set of research and synthesis papers by earth scientists from countries in this region and others provides an up to date interdisciplinary overview of the tectonic development of the Eastern Mediterranean region from Precambrian to Recent Key topics include continental rifting ophiolite genesis and emplacement continental collision extensional tectonics crustal exhumation and intra plate deformation e g active faulting Alternative tectonic reconstructions of the Tethyan orogen are presented and discussed with important implications for other regions of the world The book will be an essential source of information and interpretation for academic researchers geologists and geophysicists advanced undergraduates and also for industry professionals including those concerned with hydrocarbons minerals and geological hazards e g earthquakes

Integration of Earth Science Research on the Turkish and Greek 1999 Earthquakes Naci Görür, Gerassimos A. Papadopoulos, Nilgün Okay, 2012-12-06 In 1999 two earthquakes occurred in the Istanbul Marmara region of Turkey and the Athens Corinth region of Greece and an increased risk of further events caused great concern among the earth science community This book presents and discusses the latest results from studies of the Izmit D zce and Athens earthquakes and assesses the data that are available and relevant to the geology seismology tectonics geodesy and other fields related to earthquake studies and to evaluate earthquake hazard potential

Earthquake Monitoring and Seismic Hazard Mitigation in Balkan Countries Eystein S. Husebye, 2008-03-01 Seismology is rated the Queen of Earth Sciences due to its ability to provide detailed structural information bearing on the Earth interior and on going dynamic processes This is due to the advanced theoretical foundation of seismology and the extensive cooperation among seismologists on recording and disseminating of data worldwide In contrast some 40 years ago seismology was a backward science and hence funding was poor This abruptly changed with the political interest in seismology as the principal tool for monitoring compliance with a potential Comprehensive Nuclear Test Ban treaty CTBT banning nuclear testing in any environment Major countries like USA UK and USSR launched large scale research programs including deployment of modern seismograph stations and arrays and these developments are detailed in the book for CTBTO UN IRIS USA MedNet Italy Geofon Germany and the tiny Karelia network NW Russia Station and network operations require near real time record analysis and topics dealt with here are 2 D signal detector epicenter location and earthquake monitoring Balkan is seismically the most active part of Europe due to multiple plate interactions in the Aegean Sea The tectonic evolution and on going geodynamic deformations are described in 2 articles Earthquake hazard analysis and topographic site effects are discussed and likewise large earthquake hazards in the Aegean and the Marmara seas relate to practical applications of such procedures Foremost the book gives a good account of past present and likely future seismological developments in Balkan

Given the tremendous toll in human lives and attendant economic losses it is appropriate that scientists are working hard to understand better earthquakes with the aim of forecasting and ultimately predicting them In the last decades increasing attention has been paid to the coseismic effects on the natural environment creating a solid base of empirical data for the estimation of source parameters of strong earthquakes based on geological observations The recently introduced INQUA scale Environmental Seismic Intensity ESI 2007 Scale of macroseismic intensity clearly shows how the systematic study of earthquake surface faulting coseismic liquefaction tsunami deposits and other primary and secondary ground effects can be integrated with traditional seismological and tectonic information to provide a better understanding of the seismicity level of an area and the associated hazards At the moment this is the only scientific means of equating the seismic records to the seismic cycle time spans extending the seismic catalogues even to tens of thousands of years improving future seismic hazard analyses This Special Publication covers some of the latest multidisciplinary work undertaken to achieve that aim Eighteen papers from research groups from all continents address a wide range of topics related both to palaeoseismological studies and assessment of macroseismic intensity based only on the natural phenomena associated with an earthquake

International Handbook of Earthquake & Engineering Seismology, Part A William H.K. Lee, Paul Jennings, Carl Kisslinger, Hiroo Kanamori, 2002-09-27 Modern scientific investigations of earthquakes began in the 1880s and the International Association of Seismology was organized in 1901 to promote collaboration of scientists and engineers in studying earthquakes The International Handbook of Earthquake and Engineering Seismology under the auspices of the International Association of Seismology and Physics of the Earth's Interior IASPEI was prepared by leading experts under a distinguished international advisory board and team of editors The content is organized into 56 chapters and includes over 430 figures 24 of which are in color This large format comprehensive reference summarizes well established facts reviews relevant theories surveys useful methods and techniques and documents and archives basic seismic data It will be the authoritative reference for scientists and engineers and a quick and handy reference for seismologists Also available is The International Handbook of Earthquake and Engineering Seismology Part B 地震学辞典 Tōkyō Daigaku.
