Architectural Analysis and Performance Characterization of NVIDIA GPUs Using Microbenchmarking Saktheesh Subramoniapillai Ajeetha, 2012

Abstract Emergence of new Graphical Processors for general purpose computing presents new challenges for application developers Graphical Processors vary in terms of number of processor cores per chip processor speed and

memory subsystems NVIDIA's CUDA provides a C like abstraction layer for software developers to implement their applications on GPUs often with little knowledge of the underlying hardware and they are forced to work with high level descriptions documented by the manufacturer Substantial knowledge of the hardware architecture will be useful for harvesting the full potential of GPU architectures while trying to solve complex parallel programming problems This work reports the measurements and characterization of performance of several NVIDIA GPU's using micro benchmark analysis Our thesis uses and adapts the CUDA Micro benchmarks 8 and SHOC benchmarks 9 to characterize the important aspects of NVIDIA's GTX200 series GPU architecture machine GTX280 and Fermi series architecture machines GTX580 Tesla C2050 The investigation is conducted by performing a micro architectural analysis of these machines and comparing their basic performance parameters This thesis presents an experiment based methodology for characterizing the properties of the arithmetic pipelines We also measure the global and shared memory latency and bandwidth of these machines and validate the hardware characteristics presented in CUDA programming guide We hope that the insights from this work will be useful for improving the analysis and performance optimization of CUDA programs

Cuda for Engineers Duane Storti, Mete Yurtoglu, 2017-07-14 GPUs can be used for much more than graphics processing As opposed to a CPU which can only run four or five threads at once a GPU is made up of hundreds or even thousands of individual low powered cores allowing it to perform thousands of concurrent operations Because of this GPUs can tackle large complex problems on a much shorter time scale than CPUs Dive into parallel programming on NVIDIA hardware with CUDA by Chris Rose and learn the basics of unlocking your graphics card This updated and expanded second edition of Book provides a user friendly introduction to the subject Taking a clear structural framework it guides the reader through the subject's core elements A flowing writing style combines with the use of illustrations and diagrams throughout the text to ensure the reader understands even the most complex of concepts This succinct and enlightening overview is a required reading for all those interested in the subject We hope you find this book useful in shaping your future career Business

Performance/accuracy Trade-offs of

Floating-point Arithmetic on NVidia GPUs Sruthikesh Surineni, 2017 Floating point computations produce approximate results possibly leading to inaccuracy and reproducibility problems Existing work addresses two issues first the design of high precision floating point representations and second the study of methods to support a trade off between accuracy and performance of central processing unit CPU applications However a comprehensive study of trade offs between accuracy and performance on modern graphic processing units GPUs is missing This thesis covers the use of different floating point precisions i.e single and double floating point precision in the IEEE 754 standard the GNU Multiple Precision Arithmetic Library GMP and composite floating point precision on a GPU using a variety of synthetic and real world benchmark applications First we analyze the support for a single and double precision floating point arithmetic on the considered GPU architectures and we characterize the latencies of all floating point instructions on GPU Second a study is presented on the

performance accuracy tradeoffs related to the use of different arithmetic precisions on addition multiplication division and natural exponential function Third an analysis is given on the combined use of different arithmetic operations on three benchmark applications characterized by different instruction mixes and arithmetic intensities As a result of this analysis a novel auto tuner was designed in order to select the arithmetic precision of a GPU program leading to a better performance and accuracy tradeoff depending on the arithmetic operations and math functions used in the program and the degree of multithreading of the code
