*Multidimensional Programming* Edward A. Ashcroft, 1995 This book describes a powerful language for multidimensional declarative programming called Lucid Lucid has evolved considerably in the past ten years The main catalyst for this metamorphosis was the discovery that Lucid is based on intensional logic one commonly used in studying natural languages Intensionality and more specifically indexicality has enabled Lucid to implicitly express multidimensional objects that change a fundamental capability with several consequences which are explored in this book The author covers a broad range of topics from foundations to applications and from implementations to implications The role of intensional logic in Lucid as well as its consequences for programming in general is discussed The syntax and mathematical semantics of the language are given and its ability to be used as a formal system for transformation and verification is presented The use of Lucid in both multidimensional applications programming and software systems construction such as a parallel programming system and a visual programming system is described A novel model of multidimensional computation education is described along with its serendipitous practical benefits for harnessing parallelism and tolerating faults As the only volume that reflects the advances over the past decade this work will be of great interest to researchers and advanced students involved with declarative language systems and programming

Euro-Par'98 Parallel Processing David Pritchard, 1998-08-19 Proceedings Parallel Computing

Foundations of Parallel Programming D. B. Skillicorn, 1994-12 The major reason for the lack of use of parallel computing is the mismatch between the complexity and variety of parallel hardware and the software development tools to program it The cost of the developing software needs to be amortised over decades but the platforms on which it executes change every few years requiring complete rewrites The evident cost effectiveness of parallel computation has not been realized because of this mismatch This book presents an integrated approach to parallel software development that addresses software issues and performance issues together It presents a methodology for software construction that produces software that is architecture independent and intellectually abstract The software can execute efficiently on a range of existing and potential hardware configurations The approach is based on the construction of categorical data types a generalisation of abstract data types and of objects Categorical data types abstract both from the representation of a data type and also from the detailed control flow necessary to perform operations on it They thus impose a strong separation between the semantics on which programs can depend and the implementation which is therefore free to hide the parallel

**Multiprocessor Computer Architectures** Terry J. Fountain, Malcolm J. Shute, 1990 For over forty years most of the world has designed its computers after a single fashion This style which has come to be known as the von Neumann model after one of its originators is showing increasing signs of being inadequately powerful for future needs Efforts to discover alternative models for so long a trickle are at least becoming a flood This book reports on the current status of a number of these efforts This book is addressed to two main audiences First it is aimed at the reader who is new to the world of non von Neumann computers either in the area of design or that of application By taking the form of a catalogue of projects bound in a single volume it serves as a particularly convenient introductory text Thus it can be used to obtain a feel for the problems which designers are presently confronting and the solutions which they are developing Indeed the newcomer to the field with
