High Availability for the Lamp Stack Jason Cannon, 2014-12-17 How to Setup a Highly Available LAMP Stack Even If You ve Never Done It before Don t Know Where to Start or Don t Want to Spend Weeks Researching How to Do It This step by step guide teaches you everything you need to know in order to eliminate single points of failure for your Linux Apache MySQL and PHP based web applications Do you wish you could ensure your web site was up all the time and finally enjoy a peaceful night s sleep Do you want to be able to scale without downtime and handle unexpected surges of traffic Do you want a solution that just works without spending weeks testing various combinations of technologies and software Do you want someone to lay it all out for you and walk you through an entire deployment If so you re in the right place I understand because I ve been there I know what it s like to be

woken up in the middle of the night when a web server goes down I don't know about you but I'm fairly grumpy at 2:47 AM when something is broke and I'm the one that has to fix it That's why I strive to eliminate single points of failure and ensure service availability I would much rather plan for failure ahead of time than have to react to it If you have a robust design that's easy to support you can repair any failures at your convenience instead of trying to cobble together a makeshift solution in the middle of the night I've spent countless hours designing testing and implementing high availability solutions for a wide range of Linux based services during my career I've put together a well designed well tested solution for the LAMP Linux Apache MySQL PHP stack that easily scales to support an increasing number of users all the while decreasing downtime I've taken each possible single point of failure into account from the obvious ones to the less than obvious edge cases you'll need to cover in order to have a truly robust design This architecture and design Works on physical servers If you're running on bare metal this design will work for you Works in virtual environments such as VMWare VirtualBox Ovirt Red Hat Enterprise Virtualization RHEV KVM and Xen Works in the cloud You'll learn about the important nuances for running in the cloud This design works whether you're using Amazon Web Services AWS Rackspace Cloud or another provider Scales without downtime add more servers or resources without users even noticing Works with custom written web sites and applications that run on the LAMP stack Supports popular open source web applications such as WordPress Drupal Joomla MediaWiki phpBB Redmine SugarCRM and more This demonstrates everything step by step This is not just a design though It's an entire book complete with lessons and demonstrations you can use on actual Linux servers In the book I'll be performing the demonstrations on Ubuntu servers but the concepts are the same no matter if you're using RedHat Enterprise Linux CentOS or another distribution The only real difference is the couple of commands you'll use to perform some of the software installations The design and configurations remain the same Apply what you learn to other situations Even though this course is targeted directly at the LAMP stack Linux Apache MySQL PHP the concepts and techniques presented can be reused in a variety of other situations If you ever need a floating IP the ability to add more storage to servers without downtime to balance loads across multiple servers or deploy a highly available database cluster you can put what you learn in this course to good use The only thing between you and web site that stays up all the time is this book Get started now by scrolling up to the top of the page and clicking on the Buy now button
