Meuer,2013-03-07 Early System Analysis of Cache Performance for RISC Systems James D. Roberts,Wayne Wei-Ming Dai,1992 Abstract This report presents a prototype early analysis tool for exploring trade offs in cache architecture and packaging and interconnection P I technology for RISC microprocessor based systems We define early analysis as the evaluation of system trade offs including implementation technology effects at pre netlist phases of development Prior work in cache performance estimation and P I modeling are combined and extended to be more specific to RISC systems After describing the model several case studies are presented Although limited by the accuracy of the first order model as well as by assumptions and estimations regarding input data these studies indicate general trends and quantify several important trade offs for multi chip module systems MCM characteristics favor larger off chip caches with improved performance as well as yield advantages When combined with flip chip mounting MCM technology also permits cache system architectural changes which can significantly improve performance The prototype is not intended as a design tool but rather to demonstrate the utility and importance of an interactive early analysis tool combining architecture and implementation
