The Encyclopedia of Volcanoes Haraldur Sigurdsson, Bruce Houghton, Steve McNutt, Hazel Rymer, John Stix,2015-03-06 Volcanoes are unquestionably one of the most spectacular and awe inspiring features of the physical world Our paradoxical fascination with them stems from their majestic beauty and powerful sometimes deadly destructiveness Notwithstanding the tremendous advances in volcanology since ancient times some of the mystery surrounding volcanic eruptions remains today The Encyclopedia of Volcanoes summarizes our present knowledge of volcanoes it provides a comprehensive source of information on the causes of volcanic eruptions and both the

destructive and beneficial effects The early chapters focus on the science of volcanism melting of source rocks ascent of magma eruption processes extraterrestrial volcanism etc Later chapters discuss human interface with volcanoes including the history of volcanology geothermal energy resources interaction with the oceans and atmosphere health aspects of volcanism mitigation of volcanic disasters post eruption ecology and the impact of eruptions on organismal biodiversity Provides the only comprehensive reference work to cover all aspects of volcanology Written by nearly 100 world experts in volcanology Explores an integrated transition from the physical process of eruptions through hazards and risk to the social face of volcanism with an emphasis on how volcanoes have influenced and shaped society Presents hundreds of color photographs maps charts and illustrations making this an aesthetically appealing reference Glossary of 3 000 key terms with definitions of all key vocabulary items in the field is included

Fire and Ice Natalie Starkey, 2021-09-30 A tour of the Solar System's tallest hottest coldest and weirdest volcanoes and a look inside what makes them erupt The volcano among the most familiar and perhaps the most terrifying of all geological phenomena However Earth isn't the only planet to harbour volcanoes In fact the Solar System and probably the entire Universe is littered with them Our own Moon which is now a dormant piece of rock had lava flowing across its surface billions of years ago while Mars can be credited with the largest volcano in the Solar System Olympus Mons which stands 25km high While Mars's volcanoes are long dead volcanic activity continues in almost every other corner of the Solar System in the most unexpected of locations We tend to think of Earth volcanoes as erupting hot molten lava and emitting huge billowing clouds of incandescent ash However it isn't necessarily the same across the rest of the Solar System For a start some volcanoes aren't even particularly hot Those on Pluto for example erupt an icy slush of substances such as water methane nitrogen or ammonia that freeze to form ice mountains as hard as rock While others like the volcanoes on one of Jupiter's moons Io erupt the hottest lavas in the Solar System onto a surface covered in a frosty coating of sulphur Whether they are formed of fire or ice volcanoes are of huge importance for scientists trying to picture the inner workings of a planet or moon Volcanoes dredge up materials from the otherwise inaccessible depths and helpfully deliver them to the surface The way in which they erupt and the products they generate can even help scientists ponder bigger questions on the possibility of life elsewhere in the Solar System

Fire and Ice is an exploration of the Solar System's volcanoes from the highest peaks of Mars to the intensely inhospitable surface of Venus and the red hot summits of Io to the coldest seemingly dormant icy carapaces of Enceladus and Europa an unusual look at how these cosmic features are made and whether such active planetary systems might host life
