Probabilistic Similarity Networks:

Probabilistic Similarity Networks David E. Heckerman, 1991 In this remarkable blend of formal theory and practical application David Heckerman develops methods for building normative expert systems expert systems that encode knowledge in a decision theoretic framework Heckerman introduces the similarity network and partition two extensions to the influence diagram representation He uses the new representations to construct Pathfinder a large normative expert system for the diagnosis of lymph node diseases Heckerman shows that such expert systems can be built efficiently and that the use of a normative theory as the framework for representing knowledge can dramatically improve the quality of expertise that is delivered to the user He concludes with a formal evaluation of the power of his methods for building normative expert systems David Heckerman is Assistant Professor of Computer Science at the University of Southern California He received his doctoral degree in Medical Information Sciences from Stanford University Contents Introduction Similarity Networks and Partitions A Simple Example Theory of Similarity Networks Pathfinder A Case Study An Evaluation of Pathfinder Conclusions and Future Work *Expert Systems and Probabilistic Network Models* Enrique Castillo, Jose M. Hadi, 2012-12-06 Artificial intelligence and expert systems have seen a great deal of research in recent years much of which has been devoted to methods for incorporating uncertainty into models This book is devoted to providing a thorough and up to date survey of this field for researchers and students **Probabilistic Similarity Networks** David E.

Heckerman, Stanford University. Computer Science Department, 1990 This research suggests strongly that by identifying specific forms of conditional independence and by developing representations that exploit these forms of independence for knowledge acquisition knowledge engineers can construct normative expert systems for domains of larger scope and greater complexity than the domains previously thought to be amenable to the decision theoretic approach **Qualitative**

Methods for Reasoning Under Uncertainty Simon Parsons, 2001 Using qualitative methods to deal with imperfect information Uncertainty in Artificial Intelligence David Heckerman, Abe Mamdani, 2014-05-12 Uncertainty in Artificial Intelligence contains the proceedings of the Ninth Conference on Uncertainty in Artificial Intelligence held at the Catholic University of America in Washington DC on July 9 11 1993 The papers focus on methods of reasoning and decision making under uncertainty as applied to problems in artificial intelligence AI and cover topics ranging from knowledge acquisition and automated model construction to learning planning temporal reasoning and machine vision Comprised of 66 chapters this book begins with a discussion on causality in Bayesian belief networks before turning to a decision theoretic account of conditional ought statements that rectifies glaring deficiencies in classical deontic logic and forms a sound basis for qualitative decision theory Subsequent chapters explore trade offs in constructing and evaluating temporal influence diagrams normative engineering risk management systems additive belief network models and sensitivity analysis for probability assessments in Bayesian networks Automated model construction and learning as well as algorithms for inference

and decision making are also considered This monograph will be of interest to both students and practitioners in the fields of AI and computer science **Knowledge-Based Intelligent Information and Engineering Systems** Vasile

Palade,2003-10-25 During recent decades we have witnessed not only the introduction of automation into the work environment but we have also seen a dramatic change in how automation has influenced the conditions of work While some 30 years ago the addition of a computer was considered only for routine and boring tasks in support of humans the balance has dramatically shifted to the computer being able to perform almost any task the human is willing to delegate The very fast pace of change in processor and information technology has been the main driving force behind this development Advances in automation and especially Artificial Intelligence AI have enabled the formation of a rather unique team with human and electronic members The team is still supervised by the human with the machine as a subordinate associate or assistant sharing responsibility authority and autonomy over many tasks The requirement for teaming human and machine in a highly dynamic and unpredictable task environment has led to impressive achievements in many supporting technologies These include methods for system analysis design and engineering and in particular for information processing for cognitive and complex knowledge 1 engineering *Uncertainty in Artificial Intelligence* MKP,2014-06-28 Uncertainty Proceedings 1994
