

Probability

Expressions of probability

Probability deals with the theory of chance, and is a measure of the chance or likelihood that something will happen.

Let us illustrate this by the following example:

Problem: A spinner has four equal sectors coloured yellow, blue, red and green. What is the probability of landing on blue after spinning the spinner once?

Solution: The chances of landing on blue are 1 in 4, or one fourth. Therefore, the probability of landing on blue is one fourth, which we can also write as $\frac{1}{4}$, 0.25 or 25%.

Here are some definitions and examples from the problem above.

Definition	Example
An experiment is a situation involving chance or probability that leads to results called outcomes.	In the problem above, the experiment is spinning the spinner. Other examples are flipping a coin, or rolling a dice.
An outcome is the result of a single trial of an experiment, such as spinning the spinner once.	The possible outcomes are landing on yellow, blue, green or red. In the problem above, we were interested in the "landing on blue" outcome.
An event is one or more outcomes of an experiment.	One event of this experiment is landing on blue.
Probability is the measure of how likely an event is.	The probability of landing on blue is one fourth (that is, $\frac{1}{4}$, 0.25 or 25%).
