The resistivity of homogeneous $\{(La,...,Y_s)_{s-s},Ce,\}Al_s$ alloys was measured. From the quadratic temperature dependence of the incremental resistivity observed at low temperatures an enhancement of the Kondo temperature by two orders of magnitude is inferred. A magnetic-nonmagnetic transition was observed in dilute $(Y_1...,Ce_s)Al_s$ alloys (x=0.07).

The low temperature properties of CeAl₂ not yet completely understood are the subject of several contributions to this conference. In order to study the role of the Kondo effect in this system we have started a program in which the magnetic behavior of diluted CeAl₂ is investigated as a function of the lattice parameter.

In this paper we present preliminary resistivity data between 1.5 and 300 K of pseudobinary solutions of CeAl, in the isostructural (La, Y.) Al, matrices. The same moderate amount of CeAl, (x = 0.15) was chosen to provide a clear extraction of the magnetic resistivities from the residual and electron phonon resistivities. The latter were obtained in independent measurements from the corresponding nonmagnetic matrices. X-ray analysis reveals that all of the alloys under investigation are of single phase and that the mean lattice parameter of the matrices decreases linearly with z from a = 8.15 Å (z = 0) to a = 7.86 Å(z=1). Therefore, CeAl, (a=8.06 Å) can be either expanded or contracted by solution in an appropriate (La, ., Y,)Al2 matrix.

Details concerning preparation of the polycrystalline samples and experimental procedures will be published elsewhere [1]. We note here that the relative accuracy of the resistivity measurement is 2 × 10⁻⁴ whereas an absolute error of order 10% due to the uncertainty of the geometric factor cannot be avoided.

In fig. 1a the resistivity of five [(La₁₋,Y₋)_{0.87}Ce_{0.15}]Al₂ samples is given as a function of temperature on a logarithmic scale. There exists a resistivity minimum, which shifts to higher temperatures upon increasing Y-
