Probabilistic permeability model and the pore size density function

Jung, C.H.; Holitz, R.D.

*Int. J. Num. Anal. Meth. Geomech.* V10, N5, Sept-Oct 1986, P343-353

Mathematical interpretation of the pore size distribution (PSD) data as measured by mercury intrusion porosimetry was revealed in detail. The PSD data were expressed in a dimensionless term for convenient mathematical operations. The pore size density function was deduced from PSD data using the finite difference approximation and curve fitting technique. For the prediction of permeability, first the published correlations between permeability and pore geometry were critically reviewed. A probability model based on the pore size density function was then developed, which can be thought of as a generalization of Childs and Collis-George's model. Predictions of permeability of the compacted soils studied using the developed model were very good for a whole range of permeabilities.

Lab measurements of G<sub>max</sub> using bender elements

Dyvik, R.; Madshus, C.

*Norm. Geotech. Test. Publ.* N161, 1986, 6P

Piezoceramic bender elements can be used to measure G<sub>max</sub> in a variety of standard test equipment. An element at one end of the specimen generates a shear wave pulse, which is received by the element at the other end. Shear wave velocity, and, in turn, G<sub>max</sub> can be calculated. Bender elements were installed in a resonant column apparatus. Simultaneous determination of G<sub>max</sub> was undertaken for clays under a variety of stress and loading conditions. Results from both techniques were in excellent agreement.

Comparison of steady infiltration solutions for spherical cavities under simple versus variable hydraulic properties

Hogarth, W.L.; Parlange, J.Y.; Bradstock, R.D.

*Soil Sci. Soc. Am. J.* V51, N1, July 1986, P1-6

Infiltration of water into soil from a spherical cavity has been analyzed for the cases of both constant and variable hydraulic properties. An accurate numerical solution is obtained. The method appears very accurate and shows that soil properties distant from the source tend to dominate the flux across the boundary.

Water and air intake of surface-exposed rock fractures in situ

Kilbury, R.K.; Rasmussen, T.C.; Evans, D.D.

*Water Resour. Res.* V22, N10, Sept 1986, P1431-1443

Hydrologic characterisation of unsaturated fractured rock media is necessary as liquid phase movement may be the principal mechanism of contaminant movement from hazardous waste storages. A fractured rock infiltrometer (FRI) is used to provide in situ measurements of air and water intake rates for isolated fracture segments in an exposed, densely welded tuff. Analytical procedures are developed to estimate fracture apertures. Calculated fracture apertures from water intake data are in the range 1 - 33.7 microns, and are approximately lognormal distributed. Estimated apertures from air intake data are similarly distributed, but in the 10 - 37.2 micron range.

Free surface flow in soils

Rorghignoli, A.; Desideri, A.

*Proc. 5th International Conference on Numerical Methods in Geomechanics, Nagoya, 1-5 April 1985 V1, P363-366, Publ. Rotterdam: A. A. Balkema, 1985*

The analysis of free surface flow in soils is often complicated by the continuous change of shape of the physical domain. When standard computational techniques are used, the integration domain must be re-defined at each time step. In order to overcome this difficulty, a special approach has been adopted, based on a mapping technique by which the variable physical domain is transformed in a fixed integration domain. In this way, the mesh re-generation does not occur during the marching solution. This approach leads to simplified computational procedures even for geometrically complex problems. In fact, a suitable choice of the map often allows for the integration of the field equation over elementary domains. The input of geometrical data is also very simple. Based on this approach, a multi-purpose computer program has been written, using a finite difference scheme, in order to obtain a numerical tool useful for the solution of a large class of practical problems. Finally, the relevant results of some selected cases have been presented. Auth.

Analysis of multiple-contaminant migration through a homogeneous soil

Rowe, R.K.; Booker, J.R.

*Proc. 5th International Conference on Numerical Methods in Geomechanics, Nagoya, 1-5 April 1985 V1, P381-388, Publ. Rotterdam: A. A. Balkema, 1985*

A technique for analyzing the one-dimensional migration of several species of contaminant through a clayey soil is described. This technique permits consideration of competitive sorption-desorption of the different species. In addition, the effects of changing concentrations of the individual species both within the source leachate and within any underlying permeable layer (eg. aquifer) are considered. The application of the theory is illustrated by examining the coupled migration of two species of contaminant.

Comparison of foundation compaction techniques

Solymar, Z.V.; Reed, D.J.

*Can. Geotech. J.* V23, N3, Aug 1986, P271-280

Underlying loose non-cohesive foundation materials were found at three major construction sites. Compaction was undertaken to minimise differential settlement and lower liquefaction potential. Four densification techniques were used: vibration and impact compaction; compaction piling; and deep blasting. Site parameters are described and the reasons for choosing particular methods for particular sites are given. Improvements in terms of penetration resistance and relative density are presented, and problems arising during the work are described.

Anisotropic shrinkage of clay cores, and the interpretation of field observations of vertical soil movement

Towner, G.D.

*J. Soil Sci.* V37, N3, Sept 1986, P363-371

Saturated clay cores were first uniaxially compressed to induce an anisotropic stress state, then allowed to dry slowly. Shrinkage rate was less in the precompressed direction than in the
