Seismological and technical investigations of the mechanics of rock bursts

Knohl, P.; Kuhn, W.

Proc 2nd International Symposium on Rockbursts and Seismicity in Mines, Minneapolis, 8-10 June 1988 P129-138. Publ Rotterdam: A A Balkema, 1990.

A survey of the rock burst events in the mines of the GDR and the classification of these events using seismological methods are presented. The effects of mining activities on the triggering of seismic events are discussed. Geometrical parameters, face width and pillar dimensions, are shown to have influence on seismicity. A case study based on a potash mine is presented.

Dynamic phenomena in mines and characteristics of rocks

Homand, F.; Piguet, J P.; Revalor, R.; Josien, J P

Proc 2nd International Symposium on Rockbursts and Seismicity in Mines, Minneapolis, 8-10 June 1988 P139-142. Publ Rotterdam: A A Balkema, 1990.

A research program was conducted in order to study the relation between geomechanical or physical rock properties and the occurrence of rockbursts. The tendency of certain rock types to give rise to dynamic phenomena under a specific state of stress was studied through laboratory compression and drilling tests. The use of certain indexes (Polish WET index, decrease modulus index, brittleness index) to predict likelihood of rock burst or core dinking is examined for coal and sandstone. Statistical analysis is used to evaluate geological and mining factors of importance to reported cases of rockburst.

Microseismic activity associated with the mechanism of failure

Reymond, M C

Proc 2nd International Symposium on Rockbursts and Seismicity in Mines, Minneapolis, 8-10 June 1988 P143-145. Publ Rotterdam: A A Balkema, 1990.

Measurements of rock deformation behaviour and acoustic emissions carried out over a period of one year are presented. Laboratory tests on samples collected from a quarry were carried out by loading the samples to failure. In the quarry, acoustic emissions were measured directly from the pillars. The relations between the measured acoustic emissions and the applied load and the stress and strain are presented.

Numeric simulation of fault instabilities with a continuously-yielding joint model

Cusdall, P A; Lemos, J V

Proc 2nd International Symposium on Rockbursts and Seismicity in Mines, Minneapolis, 8-10 June 1988 P147-152. Publ Rotterdam: A A Balkema, 1990.

A numerical model has been developed to simulate the occurrence of seismic events triggered by progressive mining of an underground opening. The formulation assumes the dynamic events are caused by unstable slip on an existing rock discontinuity. The discontinuity shows displacement-weakening behaviour. The continuously-yielding joint constitutive model is described and tested numerically for several simple cases. It can satisfactorily reproduce waveforms and energy release rates which agree qualitatively with field observations. The results demonstrate that different assumptions regarding in situ stress significantly affect output.

Collapse the Heidegrove: a case history of subsidence over abandoned mine workings in Cretaceous calcarenites

Price, D G

Proc International Chalk Symposium, Brighton, 4-7 September 1989 P303-309. Publ London: Thomas Telford, 1990.

The collapse of abandoned building stone mines in Limburg, Netherlands, has been analysed and attributed to ineffect mining and slow deterioration. Mined by room and pillar methods, the workings are still safe despite a series of collapses. In analysing the causes of collapse, creep deformation, dry and saturated rock strength, pillar stability calculations, and the fracture pattern have been investigated. The surface subsidence and the impact of collapse on other abandoned mines are discussed.

Underground opening damage from earthquakes

Sharma, S; Judd, W R

Engng Geol V30, N3/4, June 1991, P263-276.

Data from 192 reports concerning behaviour of underground openings during 85 different earthquakes have been collected and analysed. A database has been built to examine significant factors affecting underground stability. Major parameters of interest are extent of damage, overburden depth, geology, type of support, and earthquake magnitude and epicentral distance. A correlation is developed between peak acceleration at the ground surface, overburden depth, and damage, which will allow preliminary assessment of stability of new structures. Safety of existing structures can be qualitatively assessed using the collected data.

Energy changes in a rockmass containing multiple discontinuities

Napier, J A L

J S Afr Inst Min Metall V91, N3, May 1991, P143-157.

Displacement discontinuity methods are widely used to model tabular mining problems. If a sufficient number of discontinuities is introduced, it is possible to simulate the zone of fracture as an elastic problem. A unified method to compute the energy changes when multiple discontinuities intersect and are extended incrementally is presented. It may be used to deduce energy release information and included in numerical analysis based on the displacement discontinuity method. Examples illustrate the effects of reef fracturing and the importance of stope-fault intersections during seismic events.

P-wave polarity patterns from mining-induced microseismicity in a hard-rock mine

Billington, S; Boller, P M; Swanson, P L; Estey, L H

Rock Mechanics Contributions and Challenges: Proc 31st US Symposium, Golden, 18-20 June 1990 P931-933. Publ Rotterdam: A A Balkema, 1990.

Part of the USBM rockburst study program is directed towards applying quantitative seismological techniques of wave form analysis to signatures of microseismic events. Examination of parameters obtained may enable in situ stress changes which are precursors of larger events to be identified. In the study area, a hard rock mine in Idaho, focal mechanism solutions are not available. However, an interim-stage analysis

Metal Matrix Composites International Conference on Composite Materials, 1993 *Recent Advances in Composite Materials* E.E. Gdoutos, Zaira Marioli-Riga, 2013-04-17 This book contains 31 papers presented at the symposium on Recent Advances in Composite Materials which was organized in honor of Professor Stephanos A Paipetis. The symposium took place at Democritus University of Thrace in Xanthi Greece on June 12-14, 2003. The book is a tribute to Stephanos A Paipetis, a pioneer of composite materials in recognition of his continuous original diversified and outstanding contributions for half a century. The book consists of invited papers written by leading experts in the field. It contains original contributions concerning the latest developments in composite materials. It covers a wide range of subjects including experimental characterization, analytical modeling and applications of composite materials. The papers are arranged in the following six sections: General concepts, stress and failure analysis, mechanical properties, metal matrix composites, structural analysis and applications of composite materials. The first section on general concepts contains seven papers dealing with composites through the pursuit of the consilience among them, computation and mechatronic automation of multiphysics research, a theory of anisotropic scattering wave propagation, multi-material composite wedges, a three-dimensional finite element analysis around broken fibers and an in situ assessment of the micromechanics of large scale bridging in ceramic composites.
