*Fundamentals Of Nuclear Models: Foundational Models* David J Rowe,John L Wood,2010-03-23 This book reviews the basic models and theories of nuclear structure and gives an in depth analysis of their experimental and mathematical foundations It shows the relationships between the models and exhibits the value of following the strategy of looking for patterns in all the data available developing phenomenological models to explain them and finally giving the models a foundation in a fundamental microscopic theory of interacting neutrons and protons This unique book takes a newcomer from an introduction to nuclear structure physics to the frontiers of the subject along a painless path It provides both the experimental and mathematical foundations of the essential models in a way that is accessible to a broad range of experimental and theoretical physicists Thus the book provides a unique resource and an exposition of the essential principles mathematical structures assumptions and observational data on which the models and theories are based It avoids discussion of many non essential variations and technical details of the models      *Non-Equilibrium Reacting Gas Flows* Ekaterina Nagnibeda,Elena Kustova,2009-07-09 In the present monograph we develop the kinetic theory of transport phenomena and relaxation processes in the flows of reacting gas mixtures and discuss its applications to strongly non equilibrium conditions The main attention is focused on the influence of non equilibrium kinetics on gas dynamics and transport properties Closed systems of fluid dynamic equations are derived from the kinetic equations in different approaches We consider the most accurate approach taking into account the state to state kinetics in a flow as well as simplified multi temperature and one temperature models based on quasi stationary distributions Within these approaches we propose the algorithms for the calculation of the transport coefficients and rate coefficients of chemical reactions and energy exchanges in non equilibrium flows the developed techniques are based on the fundamental kinetic theory principles The theory is applied to the modeling of non equilibrium flows behind strong shock waves in the boundary layer and in nozzles The comparison of the results obtained within the frame of different approaches is presented the advantages of the new state to state kinetic model are discussed and the limits of validity for simplified models are established The book can be interesting for scientists and graduate students working on physical gas dynamics aerothermodynamics heat and mass transfer non equilibrium physical chemical kinetics and kinetic theory of gases      **Nukleonika** ,1974      Proceedings of the
