**Comprehension and Its Effect on Math Problem Solving**, 2005 This project analyzed whether poor reading comprehension skills will affect the achievement of third grade students in the area of mathematics problem solving This is a problem facing teachers and administrators because problem solving is a key component of state assessments Moreover students in the United States typically score lower in mathematics than language arts on these assessments An initial awareness of this problem originated in the work setting and was then carefully scrutinized through an extensive review of the literature Upon examining the literature the writer observed that other related factors may be affecting mathematics problem solving This paper then focused on four main areas the language and personalization of mathematics word problems comorbid mathematics and reading learning disorders working memory and information processing and metacognition and mathematics problem solving After careful analysis of these four areas it was determined by the writer that poor comprehension skills can create mathematics problem solving difficulties for students A solution was then designed that combined several strategies revealed in the literature The solution complements the Everyday Mathematics curriculum that is currently implemented in the setting Specifically the solution entails the creation of a number story guide which would incorporate the language of mathematics the reinforcement of metacognitive skills and the presentation of math in a real world context      **Improving Bayesian Reasoning: What Works and Why?** Gorka Navarrete, David R. Mandel, 2016-02-02

We confess that the first part of our title is somewhat of a misnomer Bayesian reasoning is a normative approach to probabilistic belief revision and as such it is in need of no improvement Rather it is the typical individual whose reasoning and judgments often fall short of the Bayesian ideal who is the focus of improvement What have we learnt from over a half century of research and theory on this topic that could explain why people are often non Bayesian Can Bayesian reasoning be facilitated and if so why These are the questions that motivate this Frontiers in Psychology Research Topic Bayes theorem named after English statistician philosopher and Presbyterian minister Thomas Bayes offers a method for updating one's prior probability of an hypothesis  $H$  on the basis of new data  $D$  such that  $P(H|D) = \frac{P(D|H)P(H)}{P(D)}$  The first wave of psychological

research pioneered by Ward Edwards revealed that people were overly conservative in updating their posterior probabilities i.e. P(D|H) A second wave spearheaded by Daniel Kahneman and Amos Tversky showed that people often ignored prior probabilities or base rates where the priors had a frequentist interpretation and hence were not Bayesians at all In the 1990s a third wave of research spurred by Leda Cosmides and John Tooby and by Gerd Gigerenzer and Ulrich Hoffrage showed that people can reason more like a Bayesian if only the information provided takes the form of non relativized natural frequencies Although Kahneman and Tversky had already noted the advantages of frequency representations it was the third wave scholars who pushed the prescriptive agenda arguing that there are feasible and effective methods for improving belief revision Most scholars now agree that natural frequency representations do facilitate Bayesian reasoning However they do not agree on why this is so The original third wave scholars favor an evolutionary account that posits human brain adaptation to natural frequency processing But almost as soon as this view was proposed other scholars challenged it arguing that such evolutionary assumptions were not needed The dominant opposing view has been that the benefit of natural frequencies is mainly due to the fact that such representations make the nested set relations perfectly transparent Thus people can more easily see what information they need to focus on and how to simply combine it This Research Topic aims to take stock of where we are at present Are we in a proto fourth wave If so does it offer a synthesis of recent theoretical disagreements The second part of the title orients the reader to the two main subtopics what works and why In terms of the first subtopic we seek contributions that advance understanding of how to improve people's abilities to revise their beliefs and to integrate probabilistic information effectively The second subtopic centers on explaining why methods that improve non Bayesian reasoning work as well as they do In addressing that issue we welcome both critical analyses of existing theories as well as fresh perspectives For both subtopics we welcome the full range of manuscript types

**Comprehending Problem Solving** Arthur Hyde, 2014-11-13

Nationally recognized mathematics educator and author Art Hyde takes a culminating look at his thirty years of experience working with teachers and students to answer the question In the Common Core era what are the most successful practices for helping children solve mathematical problems with deep understanding The key he argues is providing positive experiences with meaningful mathematics centered around rich activities When students are given the opportunity to wrestle with appropriately difficult activities based on real life situations and intriguing contexts they become excited about the math and willingly tackle problems with more zeal and accuracy than ever before The result is deeper understanding of the content and greater skill at doing mathematics Art draws on extensive research on how children learn and the relationship between reading and mathematical comprehension His braided model of problem solving in which cognition language and mathematics are woven together intentionally forms the basis of math activities that he and numerous elementary teachers around the country have used Look into the classrooms of some of these math teachers in this book as they share their success stories illustrating the rewards of

using these activities to foster deep mathematical understanding Arthur Hyde is a professor of mathematics education at National Louis University where he received its Excellence in Teaching award While teaching high school mathematics in Philadelphia he developed a variety of creative methods for teaching math He also obtained a doctorate in curriculum and instruction from the University of Pennsylvania where he later directed its teacher education programs He has worked frequently in elementary classrooms conducting extensive professional development programs on teaching mathematics and math problem solving in Chicago and its surrounding school districts His previous books include Best Practice Fourth Edition coauthored with Steven Zemelman and Harvey Daniels Understanding Middle School Math and Comprehending Math
