

These problems are for practice in drawing your molecular orbital diagrams, molecular electron configurations and determining bond order.

The following questions pertain to the F_2 molecule:

A) Draw the molecular orbital energy diagram for this molecule. Label all of the orbitals specifically.

B) Give the molecular electron configuration for the molecule:

C) Determine the bond order for the molecule:

$$\text{Bond Order} = (10 - 8) / 2 = 1$$

D) Indicate whether the species is paramagnetic or diamagnetic:

Diamagnetic: No unpaired electrons

F) Compare the relative stability of this molecule to F_2^+ and F_2^- :

Problems In Molecular Orbital Theory:

Problems in Molecular Orbital Theory Thomas A. Albright, Jeremy K. Burdett, 1992 This supplementary problems book to be used in conjunction with a molecular orbital theory textbook at the senior first year graduate level in chemistry courses is written by leading authorities in molecular orbital theory research and teaching The text will be useful for courses in advanced inorganic physical organic and group theory Because many different compounds are presented the instructor can develop a personalized course by selecting problems from a variety of research interests Carefully worked out solutions including a large number of informal diagrams are provided for all questions and problems In addition to its practical use for courses this textbook will also be of interest to individual chemists who want to upgrade their knowledge of molecular orbital theory

Orbital Interactions in Chemistry Thomas A. Albright, Jeremy K. Burdett, Myung-Hwan Whangbo, 2013-03-28 Explains the underlying structure that unites all disciplines in chemistry Now in its second edition this book explores organic organometallic inorganic solid state and materials chemistry demonstrating how common molecular orbital situations arise throughout the whole chemical spectrum The authors explore the relationships that enable readers to grasp the theory that underlies and connects traditional fields of study within chemistry thereby providing a conceptual framework with which to think about chemical structure and reactivity problems Orbital Interactions in Chemistry begins by developing models and reviewing molecular orbital theory Next the book explores orbitals in the organic main group as well as in solids Lastly the book examines orbital interaction patterns that occur in inorganic organometallic fields as well as cluster chemistry surface chemistry and magnetism in solids This Second Edition has been thoroughly revised and updated with new discoveries and computational tools since the publication of the first edition more than twenty five years ago Among the new content readers will find Two new chapters dedicated to surface science and magnetic properties Additional examples of quantum calculations focusing on inorganic and organometallic chemistry Expanded treatment of group theory New results from photoelectron spectroscopy Each section ends with a set of problems enabling readers to test their grasp of new concepts as they progress through the text Solutions are available on the book's ftp site Orbital Interactions in Chemistry is written for both researchers and students in organic inorganic solid state materials and computational chemistry All readers will discover the underlying structure that unites all disciplines in chemistry
