

A STATISTICAL PROBLEM ARISING FROM RETROSPECTIVE STUDIES

JEROME CORNFIELD

OFFICE OF BIOMETRY, NATIONAL INSTITUTES OF HEALTH

1. Introduction

A recurring problem in medical statistics is the determination of the relative risks of developing a disease, say lung cancer, among two or more subclasses of a population, say, smokers and nonsmokers. Ordinarily, the risk for any sub-class is estimated as the ratio of the number of cases of the disease developing in that subclass to the total number of persons in it, while an estimate of the risk for one subclass relative to another is provided by the ratio of the estimated absolute risks. Studies which start in this fashion with populations classified into subgroups, for each of which one counts the number of new cases of a disease which develop during some subsequent period of time are ordinarily referred to as "forward-looking" or "prospective" studies.

One may also be concerned with other types of relative risk, for example, the relative risk of dying from a disease or of having a disease. These different relative risks need not be the same for any one disease, and in cases where they are not it is customary to attempt to estimate all three. The relative risk of developing a disease is usually referred to as the relative incidence, the relative risk of dying from it as the relative mortality, and the relative risk of having it during some specified interval of time as the relative prevalence. In diseases, such as lung cancer, where the outcome is usually fatal and the interval between detection and death is relatively constant, the difference between these three different measures of relative risk will be small. In such cases it is common to choose that relative risk which can be estimated most easily. Thus, in prospective studies of lung cancer an estimate of relative mortality is usually preferred to one of relative incidence or prevalence because (a) the death registration system provides a complete enumeration which is lacking for newly developed or for existing cases and (b) diagnosis of cause of death is usually more accurate.

The risk of developing, having, or dying from any one disease in any one year is small. For this reason prospective studies designed to supply estimates of any one of the three relative risks must cover large numbers of persons, usually kept under observation for several years. An alternative method of gathering data, which avoids the necessity of observing large numbers of persons without the disease, but which, as usually done, supplies only estimates of relative prevalence is now commonly referred to as a retrospective study. In such a study one starts with a population (or a sample of it) classified into groups having and not having the disease, and determines for each group the proportion belonging to some subclass. Thus, one might classify a population into those having and not having lung cancer and

Design of Experiments in Nonlinear Models Luc Pronzato, Andrej Pázman, 2013-04-10 Design of Experiments in Nonlinear Models Asymptotic Normality Optimality Criteria and Small Sample Properties provides a comprehensive coverage of the various aspects of experimental design for nonlinear models The book contains original contributions to the theory of optimal experiments that will interest students and researchers in the field Practitioners motivated by applications will find valuable tools to help them designing their experiments The first three chapters expose the connections between the asymptotic properties of estimators in parametric models and experimental design with more emphasis than usual on some particular aspects like the estimation of a nonlinear function of the model parameters models with heteroscedastic errors etc Classical optimality criteria based on those asymptotic properties are then presented thoroughly in a special chapter Three chapters are dedicated to specific issues raised by nonlinear models The construction of design criteria derived from non asymptotic considerations small sample situation is detailed The connection between design and identifiability estimability issues is investigated Several approaches are presented to face the problem caused by the dependence of an optimal design on the value of the parameters to be estimated A survey of algorithmic methods for the construction of optimal designs is provided

Automatentheorie und Logik Martin Hofmann, Martin Lange, 2011-03-03 Das Buch beschäftigt sich mit der Theorie endlicher Automaten auf endlichen und unendlichen Wörtern sowie Bäumen. Es behandelt klassische Resultate wie die Satz von Bchi und Rabin die zeigen wie sich monadische Logiken 2 Stufe auf diesen Strukturen mithilfe dieser Automatentheorie entscheiden lassen. Die einzelnen Kapitel sind in vier Teile zusammengefasst. Diese unterscheiden sich in den Strukturen bei denen jeweils Automatentheorie und Logik betrieben wird. Der erste Teil behandelt endliche Wörter. Der Zweite die Theorie auf den Bereich der Bäume auszudehnen. Der dritte Teil beschäftigt sich kurz mit endlichen Bäumen. Im vierten Teil geht es dann um Automatentheorie und Logik bei unendlichen Bäumen. Jeder Teil endet mit Vorschlägen für Forschungsaufgaben zu dem behandelten Stoff sowie Notizen welche auf weiterführende Literatur verweisen oder die Herkunft von präsentierten Resultaten erklären. Das Buch ist an sich ein geschlossenes Werk welches mit den bereits erworbenen Vorkenntnissen zur Theorie formaler Sprachen und zunächst ohne weitere Hilfsmittel durchgearbeitet werden kann.
