

The Local Regularity Theory for the Navier–Stokes Equations Near the Boundary

G.A. Seregin and T.N. Shilkin*

August 3, 2018

Abstract

This is an expository paper on the theory of local regularity for weak solutions to the non-stationary 3D Navier-Stokes equations near the boundary of a domain.

1 Introduction

The main problem of the modern mathematical hydrodynamics is the global well-posedness of the 3D Navier-Stokes equations, i.e. the global existence of a unique solution, corresponding to a given smooth divergent-free initial data. There are two main directions in the study of this problem. One can try to improve local well-posedness results, see classical papers [17] and [15] and many others on local well-posedness, or to show that a global weak solution, introduced essentially in [17] and [11] and called the weak Leray-Hopf solution, to the corresponding initial boundary value problem is in fact unique. On the other hand, the second aim can be achieved by proving regularity of weak solutions. Indeed, it is well-known, since the celebrated paper [17] has been published, that smoothness of weak solutions implies their uniqueness in the class of weak Leray-Hopf solutions. Here, we are going to discuss regularity of weak solutions keeping in mind that it is one of possible ways to attack the main problem on the global well-posedness. Our approach is quite typical for PDE's theory and in a sense local. The latter means that we have a solution to the Navier-Stokes system with a "finite energy" in a canonical parabolic domain and try to show that it is smoother in subdomains. The result depends on assumptions imposed on the pressure. Our choice of the class for the pressure is motivated by the linear theory and reflects the fact the whole Navier-Stokes (or Stokes) problem is not quite local because of the incompressibility condition.

Given a space-time point $z_0 = (x_0, t_0)$, the canonical domain is going to be a parabolic cylinder $Q(z_0, R) := B(x_0, R) \times]t_0 - R^2, t_0[$ if the local interior regularity is studied, or parabolic half-cylinder $Q^+(z_0, R) := B^+(x_0, R) \times]t_0 - R^2, t_0[$ if the local
