Influence of the pore pressures within the slide mass: a re-examination of the slide in Lodalen, 1954

Morrison, I M

Proc Conference on Slope Stability Engineering:

Developments and Applications, Isle of Wight, 15-18 April 1991 P51-53. Publ London: Thomas Telford, 1991

The stability of a slope is dependent on the shear strength mobilised on slide surfaces within the soil mass. For useful assessment of the contribution of these forces in terms of effective stress, it is necessary to know the pore pressures in the slide mass and to include them in the stability analysis. The case of an approximately circular slide in a cut slope in lightly overconsolidated marine clay, for which pore pressures were measured, is presented. Results indicate peak strength was mobilised within the slide mass. Errors resulting from use of incorrect interlice pore pressures are assessed.

Sensitivity analysis of spoil-pile failure in the subarctic

Huang, S L; Speck, R C; Xu, M; Chen, B; Rowland, J
Proc 6th Annual Workshop Generic Mineral Technology Center Mine Systems Design and Ground Control, Reno, 5-6 November 1990 P87-93. Publ Blacksburg: Virginia Polytechnic Institute and State University, 1990

Large scale spoil pile failures occurred at an open pit coal mine in the Lignite Creek coal basin, Alaska. Remote sensing (Landsat Thematic Mapping) images and terrain-related factors were examined using a Bayesian approach and three were identified as directly related to failures of natural slopes: coal system lithology, proximity to drainage, and occurrence of major faults. Sensitivity analysis using a finite element model indicated that saturation of footwall clay layers beneath the coal seams may initiate spoil movement. Drainage may prevent this situation arising.

Lithomonitoring in surface mining

Galperin, A M; Sereltsov, V I

Proc 6th International Congress International Association of Engineering Geology, Amsterdam, 6-10 August 1990 V3, P2187-2190. Publ Rotterdam: A A Balkema, 1990

Lithomonitoring is described, in a broad sense, as observation and control of the state of pit slopes and dump masses to ensure safe and efficient working and environmental protection. This requires geologic and hydrologic mapping, planning of the operation, and monitoring of the pit during extraction. The scale of many open pit operations makes aerial photogrammetry a useful tool for slope and dump monitoring. Optimization of pit slopes, waste heaps, and tailings dumps is essential for economic competitiveness.

Optimal design of slope excavation based on reliability analysis for Longtan hydropower project

Gao Qian; Wang Sijing

Proc 6th International Congress International Association of Engineering Geology, Amsterdam, 6-10 August 1990 V3, P2191-2198. Publ Rotterdam: A A Balkema, 1990

The Longtan project is situated on the Hongshuihe river in China. The engineering geology is complex, with 9 main bedding belts and 49 faults identified at the site. Stability of the slope of the ship lock on the right bank was a major problem at the design stage. 5 major joint groups are found in the slope rock mass. A reliability optimal slope design procedure, which can take into consideration unknown and indeterminate parameters, was chosen. The stages of selection of sample number and prediction of geologic conditions, study of

geotechnical properties, statistical evaluation of possible slide planes, choice of slope profile, and reliability analysis of slope stability are illustrated.

Probability approach to the evaluation of the stability of open pit mine slopes

Kudma, Z

Proc 6th International Congress International Association of Engineering Geology, Amsterdam, 6-10 August 1990 V3, P2223-2228. Publ Rotterdam: A A Balkema, 1990

The probabilistic approach to slope analysis for the giant Cs armady open pit brown coal mine is based on statistical analysis of the general slope angle of the defined slope rather than on safety factors. The chosen variable is easily measured and is a parameter worked with in the pit. The optimal slope angle is chosen considering the financial balance between slope reliability and profitability of mining. For the example presented, critical value of the general slope angle is 11.9 deg, which corresponds to the optimum degree of probability of deformation of 20%.

Mechanism of buckling and creep-buckling failure of the bedded rockmass on the consequent slopes

Li, Q; Zhang, Z Y

Proc 6th International Congress International Association of Engineering Geology, Amsterdam, 6-10 August 1990 V3, P2229-2233. Publ Rotterdam: A A Balkema, 1990

Bedded rockmasses on consequent slopes generally fail by toppling, when the slope angle is very steep, or sliding-bending when it is less severe. Both mechanisms are related to buckling of the bedded rock mass. Failure criteria are developed using an analysis based on an energy method of stability analysis of thin plates. The criteria are simple to apply and consistent with observed failures. Several large landslides are examined and the creep-buckling failure method proposed to explain their occurrence.

Bank stabilization and margin protection problem

Morbidoni, N P

Proc 6th International Congress International Association of Engineering Geology, Amsterdam, 6-10 August 1990 V3, P2241-2250. Publ Rotterdam: A A Balkema, 1990

A landslide in 1984 resulted in narrowing of the main bed of the Parana River, Argentina, which led to instability of the banks in the vicinity of electricity pylons. To prevent further bank recession of the bedded sand and clay soil mass, stone mattresses and gabions were used to construct flexible and permeable protection along the surface of the beach and bench toe. One pylon was further stabilised by high pressure grouting of cement soil columns to below river bed level. The second will be stabilised in a similar manner or by slope reprofiling.

Proc 6th International Congress International Association of Engineering Geology, Amsterdam, 6-10 August 1990 V3, P2251-2256. Publ Rotterdam: A A Balkema, 1990

The Tehri dam project in the Tehri formation phyllines in the Garwhal Himalaya includes a 260m high rockfill dam. Structural and tectonic data for the site have been collected and analysed to identify and classify any kinematically potential
