Proceedings Of The 6th Berkeley Math V3:

Probability Theory III Yuriy V. Prokhorov, Albert N. Shiryaev, 2013-03-14 Preface In the axioms of probability theory proposed by Kolmogorov the basic probabilistic object is the concept of a probability model or probability space This is a triple $(\Omega, \mathcal{F}, P)$ where Ω is the space of elementary events or outcomes $\mathcal{F}$ is a σ -algebra of subsets of Ω announced by the events and P is a probability measure or a probability on the measure space Ω This generally accepted system of axioms of probability theory proved to be so successful that apart from its simplicity it enabled one to embrace the classical branches of probability theory and at the same time it paved the way for the development of new chapters in it in particular the theory of random or stochastic processes In the theory of random processes various classes of processes have been studied in depth Theories of processes with independent increments Markov processes stationary processes among others have been constructed In the formation and development of the theory of random processes a significant event was the realization that the construction of a general theory of random processes requires the introduction of a flow of σ -algebras a filtration $\mathcal{F}_t$ supplementing the triple $(\Omega, \mathcal{F}, P)$ where $\mathcal{F}$ is interpreted as the collection of events from $\mathcal{F}_t$ observable up to time t
