Thirty-three years ago in 1982 he began to study the origin of life related project: the biosynthesis of membrane because he wanted to join a fundamental discussion: If the human being was created by the God or through the long course of evolution. That is an unsolved long debating even for today. And each party is actually contradictory one to another in the philosophical battlefield in human history. Four steps of the silylated aminoplastic embedding method to preserve lipid and membrane structure for electron microscopy are included with which he produced the world's first pseudocolor EM photograph in 1982. The third version was printed on or after 8/6/2015.

Fielder, 2013 seasons April 1 October 31 are presented for both sites. Maximum T at GS10 and HU10 was approximately 0.8 and 0.7 respectively and minimum levels in the understorey declined to less than 0.05 at both sites on the south side of the gaps. Growth on the sites was affected by both soil moisture and vapour pressure deficit. An additive model was used to incorporate the moisture variables with T estimates to model the effect of light on growth although replication was considered insufficient for statistical comparisons between the two sites. Growth tended to increase to a maximum at T values of approximately 0.3 and 0.8 for western hemlock *Tsuga heterophylla* Raf Sarg and western redcedar *Thuja plicata* Donn respectively and did not reach a maximum at approximately 0.8 above canopy light for Douglas fir *Pseudotsuga menziesii* Mirbel Franco and western white pine *Pinus monticola* Dougl. Light modelling with TASS III revealed both differences and similarities between the models. International Journal of Forecasting, 1994
