Rna Isolation And Characterization Protocols Methods In Molecular Biology Paperback:

RNA Isolation and Characterization Protocols Ralph Rapley, David L. Manning, 1998-04-08 Ribonucleic acids are central to cellular and molecular processes and perform vital functions in both structural and functional roles RNA molecules form the bridge between the stable genetic information contained within DNA and enzymes and proteins that carry out much of the metabolism within the cell Many of the sites of protein synthesis the ribosomes within the cell are composed of these ribonucleic acids as are the tRNA molecules that deliver the amino acid building blocks to the ribosomes Of all the RNA species the nucleic acid intermediate messenger RNA is a desirable source of material to biologists since this reflects much of what ultimately is translated into enzymes and proteins In order to determine the qualitative and quantitative changes in mRNA expression a vast number of molecular biological techniques have been developed Key molecular methods that provide the means to initially isolate and analyze RNA molecules are the focus of this volume In putting together this collection of protocols we have tried to provide techniques that are most applicable and widely used In particular there are a number of isolation techniques included that have been developed modified or adapted to enable extraction from a variety of cell types organisms or subcellular organelles Successful isolation of intact RNA is an essential starting point for any subsequent analysis This is why we have aimed to make this section comprehensive The analysis of RNA is the focus of the following chapters
