Pkg Acp Chem 221 Gillette,2002-09-01 **The Cassini-Huygens Mission** C.T. Russell,2013-03-14 The exploration of the

planets is the modern counterpart to the exploration voyages of old. To reach the new world, Columbus had to secure funding from Queen Isabella, outfit his three ships, and set sail on a long journey. To explore the American Pacific Northwest, Lewis and Clark had a similar task of obtaining funding, purchasing equipment, and going to points unknown, even though their path was across land and not sea. Today, our journey is through space rather than across land or sea, but we still travel with ships, now spaceworthy craft rather than seaworthy. Our spacecraft are smaller than the ships of yore, crammed with electronics rather than provisions, because man cannot go along on these journeys. We now rely on robots to be our eyes and ears at these distant worlds. Nevertheless, some aspects of exploration have not changed over the centuries. People are still fascinated by these unknown worlds and desire to explore them, and the process of obtaining the large sums of public money to finance these journeys still requires much pleading with authorities.

As major barriers to solar energy implementation, such as materials cost and low conversion efficiency, continue to fall, issues of intermittency and reliability have come to the fore. Scrutiny from solar project developers and their financiers on the accuracy of long-term resource projections, and grid operators' concerns about variable short-term power generation, have made the field of solar forecasting and resource assessment pivotally important. This volume provides an authoritative voice on the topic, incorporating contributions from an internationally recognized group of top authors from both industry and academia, focused on providing information from underlying scientific fundamentals to practical applications, and emphasizing the latest technological developments driving this discipline forward. The only reference dedicated to forecasting and assessing solar resources, it enables a complete understanding of the state of the art from the world's most renowned experts. Demonstrates how to derive reliable data on solar resource availability and variability at specific locations to support accurate prediction of solar plant performance and attendant financial analysis. Provides cutting

edge information on recent advances in solar forecasting through monitoring satellite and ground remote sensing and numerical weather prediction
