Riemann's Boundary Problem With Infinite Index Operator Theory Advances And Applications Vol 67:

M.G. Krein's Lectures on Entire Operators Valentina Gorbachuk, 2012-12-06 This book is devoted to the theory of entire Hermitian operators an important branch of functional analysis harmoniously combining the methods of operator theory and the theory of analytic functions This theory enables various problems of classical and modern analysis to be looked at from a uniform point of view In addition it serves as a source for setting and solving many new problems in both theories The three chapters of the book are based on the notes written by his students of M G Krein's lectures on the theory of entire operators with $1/1$ deficiency index which he delivered in 1961 at the Pedagogical Institute of Odessa and on his works on the extension theory of Hermitian operators and the theory of analytic functions The theory is further developed in the direction of solving the problems set up by Krein at ICM 66 in the first two appendices The first concerns the case of Hermitian operators with arbitrary defect numbers entire with respect to an ordinary gauge and to a generalized one as well The other focuses on the entire operators representable by differential operators The third appendix is the translation from Russian of the unpublished notes of Krein's lecture in which in particular the place of the theory of entire operators in the whole analysis is elucidated In Krein's mathematical heritage the theory of entire operators occupies a special position

Orthogonal Systems and Convolution Operators Robert Ellis, Israel Gohberg, 2003 The main concern of this book is the distribution of zeros of polynomials that are orthogonal on the unit circle with respect to an indefinite weighted scalar or inner product The first theorem of this type proved by M G Krein was a far reaching generalization of G Szeg's result for the positive definite case A continuous analogue of that theorem was

proved by Krein and H Langer These results as well as many generalizations and extensions are thoroughly treated in this book A unifying theme is the general problem of orthogonalization with invertible squares in modules over C algebras Particular modules that are considered in detail include modules of matrices matrix polynomials matrix valued functions linear operators and others One of the central features of this book is the interplay between orthogonal polynomials and their generalizations on the one hand and operator theory especially the theory of Toeplitz matrices and operators and Fredholm and Wiener Hopf operators on the other hand The book is of interest to both engineers and specialists in analysis

Matrix and Operator Valued Functions I. Gohberg, L.A. Sakhnovich, 2012-12-06 This book is dedicated to the memory of an outstanding mathematician and personality Vladimir Petrovich Potapov who made important contributions to and exerted considerable influence in the areas of operator theory complex analysis and their points of juncture The book commences with insightful biographical material and then presents a collection of papers on different aspects of operator theory and complex analysis covering those recent achievements of the Odessa Kharkov school in which Potapov was very active The papers deal with interrelated problems and methods The main topics are the multiplicative structure of contractive matrix and operator functions operators in spaces with indefinite scalar products inverse problems for systems of differential equations interpolation and approximation problems for operator and matrix functions The book will appeal to a wide group of mathematicians and engineers and much of the material can be used for advanced courses and seminars

Convolution Operators and Factorization of Almost Periodic Matrix Functions Albrecht Böttcher, Yuri I. Karlovich, Ilya M. Spitkovsky, 2012-12-06 Many problems of the engineering sciences physics and mathematics lead to convolution equations and their various modifications Convolution equations on a half line can be studied by having recourse to the methods and results of the theory of Toeplitz and Wiener Hopf operators Convolutions by integrable kernels have continuous symbols and the Cauchy singular integral operator is the most prominent example of a convolution operator with a piecewise continuous symbol The Fredholm theory of Toeplitz and Wiener Hopf operators with continuous and piecewise continuous matrix symbols is well presented in a series of classical and recent monographs Symbols beyond piecewise continuous symbols have discontinuities of oscillating type Such symbols emerge very naturally For example difference operators are nothing but convolution operators with almost periodic symbols the operator defined by
