

SECOND CONFERENCE ON TALL BUILDINGS IN SEISMIC REGIONS

MAY 16 AND 17, 1991, LOS ANGELES, CALIFORNIA, USA

D. R. Brunsdon*

INTRODUCTION

This article reviews the Second Conference on Tall Buildings in Seismic Regions held in Los Angeles on May 16 and 17, 1991. This conference was organised jointly by The Los Angeles Tall Buildings Structural Design Council and The Council on Tall Buildings and Urban Habitat.

Approximately 150 delegates from nine countries attended the conference, including the writer.

The stated purpose of the conference was to overview current and future trends in design and construction of tall buildings for seismic and wind effects.

The following papers were prepared for and presented at the conference by New Zealand engineers:

"Design and Construction of the National Bank Centre, Auckland"
Kevin C.F. Spring and G.K. Sidwell
(Rankine and Hill Limited).

"Implications of the 1989 Newcastle Earthquake on the Design and Construction of Tall Buildings in Australia"
David Brunsdon and James Forbes (Irwin Johnston and Partners, Sydney).

This review comments briefly under various headings on items presented or discussed at the conference that are considered to be of interest, based on the sessions attended by the writer.

BUILDING APPROVAL PROCESSES

The first plenary session of the conference featured Los Angeles-based property developers and consultants reviewing the various steps involved in obtaining authorities approvals for a multi-storey project in Los Angeles and the changes to those steps that have occurred over the last five years. The main point of interest in this presentation was the increasingly political nature of the approvals process in Los Angeles, and the implications for other cities.

Key changes in the approvals process include the following:

- The obligation to satisfy onerous new State and Federal requirements in addition to the established City planning conditions. One such recent requirement is the need for an Environmental Impact Report for virtually every land development project, including those in the centre of the city.
- Elected city officials having greater input in and control over the process, with correspondingly less involvement from employed officers. Many of these elected officials have won office on "no growth" platforms. In addition, some Councils now require a unanimous vote in favour of a project before approval is given, rather than the former majority decision.
- Associated with the involvement of elected officials has been the trend towards the imposition of additional "city amenity fees" on a project-by-project (i.e. ad hoc) basis.

As an indication of the impact of these changes, it was estimated that a project which took nine months to gain authorities approval in 1987 would currently require at least three and possibly five years for the corresponding approval. The consequential increase in overall project costs has represented another negative influence on a recessionary real estate market.

LATERAL LOAD RESISTING SYSTEMS FOR TALL BUILDINGS

Various case studies of recently designed tall buildings were presented, and each featured one of the three following lateral load resisting systems:

- moment resisting steel frames,
- moment resisting ductile concrete frames,
- reinforced concrete shear walls.

A recent variation to the conventional ductile beam and column frame is the development of a modular virescedel subframe for resisting lateral loads. This system has been developed in response to the many architectural constraints in the lower levels of buildings where a large proportion of perimeter columns cannot pass without
