Introduction: Psychotherapy research has long preferred explanatory over predictive models. As a result, psychotherapy research is currently limited in the variability that can be accounted for in the process and outcome of treatment. The present study is a proof-of-concept approach to psychotherapy science that uses a data-driven approach to achieve robust predictions of the process and outcome of treatment.

Methods: A trial including 65 therapeutic dyads was designed to enable an adequate level of variability in therapist characteristics, overcoming the common problem of restricted range. A mixed-model, data-driven approach with cross-validation machine learning algorithms was used to predict treatment outcome and alliance (within- and between-clients; client- and therapist-rated alliance).

Results and discussion: Based on baseline predictors only, the models explained 52.8% of the variance for out-of-sample prediction in treatment outcome, and 24.1–52.8% in therapeutic alliance. The identified predictors were consistent with previous findings and point to directions for future investigation. Although limited by its sample size, this study serves as proof of the great potential of the presented approach to produce robust predictions regarding the process and outcome of treatment, offering a potential solution to problems such as p-hacking and lack of replicability. Findings should be replicated using larger samples and distinct populations and settings.

1 Introduction

Traditionally, statistical goals can be divided into two categories: explanation-oriented models, in which researchers are interested in testing an *a priori* hypothesized relationship between two or more variables, and prediction-oriented models, in which researchers are interested in finding an algorithm capable of recognizing which set of variables yields the best predictions about new observations (1, 2). For many years, psychotherapy research focused mainly on models aimed at understanding and explaining associations between variables (3). Many hundreds of studies testing predictors, moderators, and mediators have contributed greatly to our understanding of the process and outcome of psychotherapy (2). For instance, research has shown that the therapeutic alliance is strongly related to improved treatment

Gelo, Alfred Pritz, Bernd Rieken, 2014-12-24 This book provides readers with essential information on the foundations of psychotherapy research and on its applications to the study of both psychotherapy process and outcome The aim is to stimulate a reflection on these issues in a way that will benefit researchers and clinicians as well as undergraduate and graduate students at different levels and from different perspectives Accordingly the book presents a balanced mix of chapters summarizing the state of the art in the field from different viewpoints and covering innovative topics and perspectives reflecting some of the most established traditions and at the same time emerging approaches in the field in several countries The contributors who were invited from among the experts in our national and international professional networks also represent a healthy mix of leading figures and young researchers The first part of the book addresses a number of fundamental issues in psychotherapy research at a historical philosophical and theoretical level The second part of the book is concerned with research on psychotherapy processes in this regard both quantitative and qualitative approaches are given equal consideration in order to reflect the growing relevance of the latter The book's third and last part examines research on psychotherapy outcomes primarily focusing on quantitative approaches Offering a balanced mix of perspectives approaches and topics the book represents a valuable tool for anyone interested in psychotherapy research **Mental**

Health, Epidemiology and Machine Learning Marcos Del Pozo Banos, Robert Stewart, Ann John, 2025-01-23 Mental health disorders are underlain by a wide diversity of influencing factors and they exert their impact across multiple domains in a patient's life As such mental health research has greatly benefited from the proliferation of large and diverse databanks with many and new types of data often covering a large sample of or even whole populations However traditional epidemiological and statistical techniques have proven to be insufficient to tackle the complexity of mental illness While such data have spurred important advances in the area of mental health they have also introduced new limitations that risk stalling progress In this context machine learning provides in theory novel opportunities to leverage the potential of databanks and propel population mental health research forward Indeed after a slower introduction compared to other health specialties the popularity of machine learning in this field has soared in recent years Unfortunately on many occasions the use of machine learning has overshadowed epidemiological practice thus limiting the production of results that have genuine clinical relevance Without careful integration there is a real risk of losing the trust and confidence that machine learning has slowly gained within the clinical field Prediction in Psychotherapy Research , 1968 *Prediction in Psychotherapy Research*
