Predictive Control 1 E:

Model Predictive Control in the Process Industry Eduardo F. Camacho, Carlos A. Bordons, 2012-12-06 Model Predictive Control is an important technique used in the process control industries It has developed considerably in the last few years because it is the most general way of posing the process control problem in the time domain The Model Predictive Control formulation integrates optimal control stochastic control control of processes with dead time multivariable control and future references The finite control horizon makes it possible to handle constraints and non linear processes in general which are frequently found in industry Focusing on implementation issues for Model Predictive Controllers in industry it fills the gap between the empirical way practitioners use control algorithms and the sometimes abstractly formulated techniques developed by researchers The text is firmly based on material from lectures given to senior undergraduate and graduate students and articles written by the authors

Model Predictive Control Eduardo F. Camacho, Carlos Bordons Alba, 2013-01-10 The second edition of Model Predictive Control provides a thorough introduction to theoretical and practical aspects of the most commonly used MPC strategies It bridges the gap between the powerful but often abstract techniques of control researchers and the more empirical approach of practitioners The book demonstrates that a powerful technique does not always require complex control algorithms Many new exercises and examples have also been added throughout Solutions available for download from the authors website save the tutor time and enable the student to follow results more closely even when the tutor isn't present

Hybrid PID Based Predictive Control Strategies for WirelessHART Networked Control Systems Sabo Miya Hassan, Rosdiazli Ibrahim, Nordin Saad, Kishore Bingi, Vijanth Sagayan Asirvadam, 2020-05-12 Recent advances in wireless technology have led to the emergence of industry standards such as WirelessHART These strategies minimise the need for cumbersome cabling thereby reducing costs However applying them involves the challenge of handling stochastic network delays which can degrade control performance To address this problem commonly used simple PID could be employed However PID suffers from gain range limitations when used in a delayed environment Furthermore model based controllers are complex and require exact models of the process and systematic system identification for implementation Therefore to address these issues the book proposes control strategies that retain the simplicity of PID in terms of ease of tuning and structure while improving on the performance of the closed loop system with regard to stochastic network delays and mismatches Concretely it proposes and discusses three strategies namely Setpoint Weighting SW Filtered Predictive PI FPPI and Optimal Fuzzy PID In order to optimise some of these controllers two novel hybrid optimisation algorithms combining the dynamism of the Bacterial Foraging Algorithm BFA and advantages of both the Spiral Dynamic Algorithm SDA and the Accelerated Particle Swarm Optimisation APSO have been used The strategies proposed here can also be applied in stochastic control scenarios not necessarily wireless characterised by uncertainties This book will be useful to engineers and researchers in both industry and academia In industry it will be particularly useful to research and development efforts

where PID controllers and wireless sensor networks WSNs involving both short and long term stochastic network delay are employed Thus it can be used for real time control design in these areas In the academic setting the book will be useful for researchers undergraduate and graduate students of instrumentation and control It can also be used as reference material for teaching courses on predictive and adaptive controls and their application

Nonlinear Model Predictive Control

Lalo Magni, Davide Martino Raimondo, Frank Allgöwer, 2009-05-18 Over the past few years significant progress has been achieved in the field of nonlinear model predictive control NMPC also referred to as receding horizon control or moving horizon control More than 250 papers have been published in 2006 in ISI Journals With this book we want to bring together the contributions of a diverse group of internationally well recognized researchers and industrial practitioners to critically assess the current status of the NMPC field and to discuss future directions and needs The book consists of selected papers presented at the International Workshop on Assessment and Future Directions of Nonlinear Model Predictive Control that took place from September 5 to 9 2008 in Pavia Italy

Networked Predictive Control of Systems with Communication

Constraints and Cyber Attacks Zhong-Hua Pang, Guo-Ping Liu, Donghua Zhou, Dehui Sun, 2018-06-12 This book presents the latest results on predictive control of networked systems where communication constraints e g network induced delays and packet dropouts and cyber attacks e g deception attacks and denial of service attacks are considered For the former it proposes several networked predictive control NPC methods based on input output models and state space models respectively For the latter it designs secure NPC schemes from the perspectives of information security and real time control Furthermore it uses practical experiments to demonstrate the effectiveness and applicability of all the methods bridging the gap between control theory and practical applications The book is of interest to academic researchers R D engineers and graduate students in control engineering networked control systems and cyber physical systems

Model Predictive Control for Nonlinear Continuous-Time Systems with and Without Time-Delays

Marcus Reble, 2013 The objective of this thesis is the development of novel model predictive control MPC schemes for nonlinear continuous time systems with and without time delays in the states which guarantee asymptotic stability of the closed loop The most well studied MPC approaches with guaranteed stability use a control Lyapunov function as terminal cost Since the actual calculation of such a function can be difficult it is desirable to replace this assumption by a less restrictive controllability assumption For discrete time systems the latter assumption has been used in the literature for the stability analysis of so called unconstrained MPC i e MPC without terminal cost and terminal constraints The contributions of this thesis are twofold In the first part we propose novel MPC schemes with guaranteed stability based on a controllability assumption whereas we extend different MPC schemes with guaranteed stability to nonlinear time delay systems in the second part In the first part of this thesis we derive explicit stability conditions on the prediction horizon as well as performance guarantees for unconstrained MPC Starting from this result we propose novel alternative MPC formulations based on combinations of the controllability assumption with

terminal cost and terminal constraints One of the main contributions is the development of a unifying MPC framework which allows to consider both MPC schemes with terminal cost and terminal constraints as well as unconstrained MPC as limit cases of our framework In the second part of this thesis we show that several MPC schemes with and without terminal constraints can be extended to nonlinear time delay systems Due to the infinite dimensional nature of these systems the problem is more involved and additional assumptions are required in the controller design We investigate different MPC schemes with and without terminal constraints and or terminal cost terms and derive novel stability conditions Furthermore we pay particular attention to the calculation of the involved control design parameters

Model Predictive Control System Design and Implementation Using MATLAB® Liuping Wang, 2009-03-04 Model Predictive Control System Design and Implementation Using MATLAB proposes methods for design and implementation of MPC systems using basis functions that confer the following advantages continuous and discrete time MPC problems solved in similar design frameworks a parsimonious parametric representation of the control trajectory gives rise to computationally efficient algorithms and better on line performance and a more general discrete time representation of MPC design that becomes identical to the traditional approach for an appropriate choice of parameters After the theoretical presentation coverage is given to three industrial applications The subject of quadratic programming often associated with the core optimization algorithms of MPC is also introduced and explained The technical contents of this book is mainly based on advances in MPC using state space models and basis functions This volume includes numerous analytical examples and problems and MATLAB programs and exercises
